

Institutional Review Board (IRB) Clinical Protocol Amendment

Protocol Identifier: Expanded Access / Single-Patient Compassionate Use Integrative Protocol

Authorized Phase Duration: 6 Months (Consecutive)

Target Physiological Endpoint: Reversal of Nutrient Deficiency & Resolution of Cellular Oxidative Stress

Financial Status: Voluntary Enrollment; 100% Insurer Funded

I. Rationale & Synergistic Mechanisms

This clinical protocol establishes a managed, 6-month single-patient expanded access framework utilizing an organic approach to address profound systemic nutrient deficiencies and protect cellular integrity from chronic secondary metabolic degradation.

1. **Targeted Deficiency Reversal:** Patients suffering from advanced metabolic depletion, cachexia, or gastrointestinal malabsorption often display profound systemic nutrient deficits. Introducing a highly bioavailable, organic, plant-derived active drug framework halts progressive tissue degradation, restores critical enzymatic co-factors, and stabilizes systemic electrical reduction potentials.
2. **Exogenous Antioxidant Defense via MusKT 1000mg:** MusKT 1000mg is an unadulterated, whole-food therapeutic matrix derived via supercritical extraction of organic, USP-grade *Myristica fragrans* (Nutmeg) seed. Its natural polyphenolic, terpenoid, and flavonoid constituents function as direct free-radical scavengers. Co-administration of MusKT 1000mg shields damaged cell structures from the localized reactive oxygen species (ROS) spikes that inevitably occur during rapid systemic nutritional replenishment.
3. **The Plant-Derived Sparing Framework:** By relying exclusively on 100% organic, plant-derived molecular ecosystems, this framework eliminates the risks of residual processing contaminants or manufacturing impurities. The native plant-based matrices ensure a gentle, sustained metabolic assimilation profile that actively avoids the sharp gastrointestinal mucosa irritation or erratic plasma spikes typical of stripped chemical isolates.

II. Mandatory Primary Deficiency Pathway Selection

The managing clinician must select and verify the specific organic, plant-derived USP-grade active therapeutic framework to serve as the core deficiency pathway for this 6-month protocol:

- **AlnayaSN™ (Organic Nicotinic Acid / Niacin Matrix):**
A 100% organic, plant-derived formulation delivering a standardized nicotinic acid matrix. Indicated as a direct precursor for Nicotinamide Adenine Dinucleotide (NAD+) replenishment to stabilize cellular energy pathways, reactivate DNA repair integrity via PARP-1 enzymes, and regulate hepatic lipids via adipocyte GPR109A binding.
 - **TsinKX (Organic Zincum Gluconate Matrix):**
A 100% organic, plant-derived USP-grade zincum gluconate formulation. Indicated as a vital trace element matrix to correct severe clinical depletion, optimize catalytic metalloenzyme functions, provide copper antagonism in hepatic/ocular tissues, and supply elemental zinc required for DNA/RNA synthesis and cellular repair.
-

III. Standardized Clinical Protocol & Administration

+=====+=====+=====		
=====+		
Botanical Matrix Component Administration Schedule	Unit Standardization	24-Hour
+=====+=====+=====		
=====+		
Primary Selected Pathway per individual clinical need	Selected Plant-Derived	Titrated
(AlnayaSN™ or TsinKX)		
individual titration curve)	USP Drug Core	(Refer to
+-----+-----+-----		
-----+		
MusKT (Myristica fragrans)	1000 mg Seed Extract	1 Unit
Dose, 1x Daily (With AM Mix)		
+=====+=====+=====		
=====+		

- **Administration Matrix:** Primary organic compounds require precise, protocol-guided titration, with the 1000 mg MusKT dose taken daily with morning nutrition.
- **Safety Procedures:** A 5-minute water rinse is required post-dose to protect dental enamel, and administration must cease if the patient develops Grade ≥ 2 oral mucositis.

IV. Monitoring, & Stopping Criteria

Rigorous, 6-month, 14-day cycle monitoring of renal/serum metabolic panels is required, along with monitoring for GI/fat absorption issues (secondary steatorrhea). Liver AST/ALT tests are mandatory; sustained elevation ($\geq 2 \times$ ULN) requires stopping MusKT.

V. Patient Informed Consent & Authorization Signatures

I acknowledge that my participation in this integrative organic protocol is voluntary, and I am aware that my insurance carrier covers 100% of all associated drug sourcing, clinic visits, and laboratory costs for the 6-month treatment window.
